****Likely Diagnosis****

Based on the provided Electronic Health Record (EHR) data, the clinician's assessment states the likely diagnosis as ****Chronic mechanical low back pain****.

This assessment is strongly supported by the patient's presentation:

- * ****Chief Complaint:**** "Chronic lower back pain"
- * ****History of Present Illness:**** Pain for 3 months, exacerbated by sitting, without reported trauma or neurological deficits (no numbness/tingling), consistent with a chronic mechanical origin.
- * ****Physical Exam:**** Findings of "Tenderness over L4-L5" and "limited forward flexion" are classic signs associated with mechanical low back pain, as highlighted in the provided literature (``literature_example.pdf``).

Furthermore, the patient's past medical history of Hypertension and Hyperlipidemia are noted as common comorbidities in patients with chronic low back pain, according to the provided literature (``literature_example.pdf``). The proposed management plan, including physiotherapy referral, core strengthening exercises, NSAIDs PRN, and follow-up, aligns directly with the evidence-based recommendations for Chronic Low Back Pain described in the literature.
